

CHME 2310 UO lab post-visit deliverable

Due date: April 3rd 2026

Pumps

Produce pump curves, system curves, and calculate the efficiency of the pump. Use the data you collected in the worksheet during class and pool data from other class groups to create an overall dataset. Consider the graph below as inspiration although your graph may not look exactly like this for a number of reasons.

Frictional losses through pipes

Calculate frictional losses, pressure drop, and Reynolds number across various pipe sizes and flow rates. Compare the calculated frictional losses to theoretical values. What relationships can you determine between these properties? Can you create universal curves or are these relationships per pipe? Does any of your data stand out as having significant error or needing to be recollected?

Deliverables

1. 1-2 graphs per experiment
2. 1 paragraph writeup per experiment describing what you could vary and measure, your key findings, and how you related them to key equations we have learned in class
